Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1906 Excerpt: .slide has a tilting portion (shown elevated to an angle in the illustration), providing for the various bevels of wheels. Provision is given for varying feeds to suit the cut, and metal. The leading types of gear-cutters will be illustrated in these volumes. The following remarks indicate the broad lines along which the development of the automatic machines has taken place. There are many machines which are so far automatic in character that the whole of the flanks facing in one direction are produced without attendance, in others, both flanks are done. The gears which lend themselves best to fully automatic work are the spurs, because the flanks of the teeth are parallel, and opposite flanks are therefore produced at once by a cutter which is an exact counterpart of their shapes. The only special mechanism then required is that for automatic pitching, locking, and release. The case of bevel wheels is different, because the cross sections of the teeth, and tooth spaces change constantly, and this is a much more difficult problem to deal with than the mere pitching of teeth. Hence until a comparatively recent period, automatic cutting was restricted to spur gears, large numbers of machines for which are in use. Successful semi-automatic bevel gear cutting machines are made, using rotary cutters, and having provision for cutting all one side of the teeth without attention. But the ordinary rotary cutter is being largely displaced by reciprocating planing tools, and by special forms of...
